

There are many reasons why I would like to be a scientist. Science is one of the most important and well-educated lines of work. The three types of science that I like the most are marine biology, astronomy, and animals.

I like marine biology because of all the wonders under the ocean. It is neat how all of the different life forms are needed to keep the balance of the ecosystem. I would like to discover ways to go all of the way to the ocean floor in the deepest known areas. I would also like to discover new plants and animals to turn the tide of science.

I also like astronomy because there are places out there that are said to be unreachable. Today's scientists are too busy looking at rock samples from the moon to know the limit of their reach in space. I would

also like to try to discover ways to send our men and probes farther and faster into space. I would like to be the first human to ever break the galaxy barriers. The scientists say that it is impossible to go further than we already have, when all we need to do is pull our resources together to find a better way.

I like the study of animals because every day a new species is being driven to extinction. No matter how small or big the animal is it still has an important role to play. I would like to study animals and find out if there is a way to understand them. I would like to find ways to preserve the animal life so future generations would have the chance to see all of the wonderful things about animals. Those are a few of the many reasons of why

I would like to be a scientist. Some people may not know how important science is but, I am glad that I know what it is. Some of the fields of science are marine biology, astronomy, and animals.
